

The logo for the RYYR-1 Foundation. The letters 'RYYR-1' are rendered in a stylized, dark red font where each letter is filled with a complex, organic, leaf-like pattern. Below this, the word 'FOUNDATION' is written in a clean, dark red, sans-serif, all-caps font.

RYYR-1 FOUNDATION

www.ryr1.org

The mission of the RYYR-1 Foundation is to:

- 1) Support research leading to an effective treatment or a cure for RYYR-1-related diseases and
- 2) Provide education, outreach, and advocacy for individuals and families affected by RYYR-1-related diseases.

“Everyday I am thankful for the RYR-1 Foundation and what they have done to not only further research for treatments and a possible cure, but for also bringing so many families together.

ATTENDEE, 2018 RYR-1 INTERNATIONAL FAMILY CONFERENCE

DEAR FRIENDS,

Although rare, RYR-1-related diseases are the most common form of “congenital myopathy” -- muscle disease caused by a genetic mutation. The most common manifestations include: mild-to-moderate muscle weakness (e.g., difficulty climbing stairs), severe weakness (e.g., requiring wheelchair assistance and breathing support), muscle cramping and pain, and a potentially fatal reaction to anesthesia, called malignant hyperthermia. Yet, despite the prevalence of this disease and the severity of these symptoms, the RYR-1 Foundation is the only organization that exists solely to support research on this disease. Further, the RYR-1 Foundation serves the needs of and advocates for RYR-1-affected individuals and their families.

In a very short period of time, it has become a leader in the field of RYR-1-related diseases.

Due to the support of our many generous benefactors, the Foundation’s work has led to important breakthroughs in scientific knowledge. In addition, we have formed a worldwide community of affected individuals who can find comfort and support in the knowledge that they are not alone and that our organization now exists to help them.

The need for treatments or a cure is urgent. With your support, the RYR-1 Foundation can continue to fund world-renowned scientists, expand the RYR-1 community, and make our slogan, “Strength in Numbers,” a reality.

Sincerely yours,

Michael F. Goldberg, MD, MPH
President & Co-Chair of Research
RYR-1 Foundation

To learn more about the story of the RYR-1 Foundation and the work we are doing, please view our documentary at:

WWW.RYR1.ORG/DOCUMENTARY

SUPPORTING RESEARCH

The Foundation exists to raise funds that support both basic science and clinical research of RYR-1-related diseases. Funding research gives us the best chance to find a treatment or a cure for this disease.

As of 2018, the RYR-1 Foundation has funded over **\$870,000** in RYR-1-related research. This has already led to important advances in knowledge and potential therapies. RYR-1 Foundation grant recipients include:

**ALAN BEGGS, PhD, HARVARD UNIVERSITY
(UNITED STATES):**

“Drug Discovery for RYR-1 Myopathies Using Zebrafish Models”

**WILLIAM R. LAGOR, PhD, BAYLOR COLLEGE OF
MEDICINE (UNITED STATES):**

“Targeted Removal of Pathogenic RYR-1 Alleles”

**JAMES DOWLING, MD, PhD, UNIVERSITY OF
TORONTO (CANADA):**

“Cas9-Mediated Point Mutagenesis of RYR-1”

**ANDREW MARKS, MD, COLUMBIA UNIVERSITY
(UNITED STATES) AND KATHERINE MEILLEUR,
PHD, CRNP, NATIONAL INSTITUTES OF HEALTH
(UNITED STATES):**

“Rycal Treatment in RYR-1-Related Myopathy Muscle Biopsies”

**JAMES DOWLING, MD, PhD, UNIVERSITY OF
TORONTO (CANADA) AND ROBERT DIRKSEN, PhD,
UNIVERSITY OF ROCHESTER (UNITED STATES):**

“Drug Discovery and Validation for RYR-1-Related Myopathies”

**FILIP VAN PETEGEM, PhD, UNIVERSITY OF
BRITISH COLUMBIA (CANADA):**

“Structural Investigation of Disease-Associated Mutations in the Ryanodine Receptor Pore and EF Hand Region”

**ANGELA DULHUNTY, MD, PhD, AUSTRALIAN
NATIONAL UNIVERSITY (AUSTRALIA):**

“Developing Animal Models with an RYR-1 Mutation and Clinical Phenotype for the Purpose of Evaluating Cell and Molecular Mechanisms of RYR-1 Disease”

**KANG ZHANG, MD, PhD, UNIVERSITY OF
CALIFORNIA, SAN DIEGO (UNITED STATES)
AND ROBERT DIRKSEN, PHD, UNIVERSITY OF
ROCHESTER (UNITED STATES):**

“HITI-Mediated Gene Editing for RYR-1 Myopathy”

**ALEXANDER KUSHNIR, MD, PhD, COLUMBIA
UNIVERSITY (UNITED STATES):**

“RYR-1 Myopathy Database”

RYCAL TREATMENT IN RYR-1-RELATED MYOPATHY MUSCLE BIOPSIES

In 2016, the RYR-1 Foundation awarded a grant of \$80,000 to Dr. Andrew Marks, Chairman of the Department of Physiology and Cellular Biophysics at Columbia University, and Dr. Katherine Meilleur, Assistant Clinical Investigator at the National Institute of Nursing Research, for their research project entitled Rycal Treatment in RYR-1-Related Myopathy Muscle Biopsies.

Dr. Marks discovered Rycals, a class of drugs that reverses the calcium “leak” in muscle cells with RYR-1 mutations. The grant from the RYR-1 Foundation allowed Drs. Marks and Meilleur to assess the effect of Rycals on samples of muscle biopsies taken from RYR-1 patients. The results of their study showed that Rycals not only reversed the calcium leak in those muscle biopsies, but also repaired muscle damage and improved the muscle function.

ARMGO Pharma Receives FDA Orphan Drug Designation for ARM210/S48168 for the Treatment of Ryanodine Receptor Type 1 Related Myopathies

SHARE THIS ARTICLE

ARDSLEY, N.Y., Sept. 5, 2018 /PRNewswire/ - ARMGO Pharma, Inc., a clinical stage biopharmaceutical company advancing a novel class of small molecule drugs known as Rycals®, announced today that the U.S. Food and Drug Administration (FDA) has granted orphan drug designation to ARM210 (also known as S48168), a potential treatment for patients with Ryanodine Receptor Type 1 Related Myopathies (RYR1-RM). In 2015, the FDA granted orphan drug designation and rare pediatric disease designation to ARM210 as a potential treatment for Duchenne Muscular Dystrophy (DMD).

ARMGO Press Release, Dated September 5, 2018, Announcing Orphan Drug Designation for Rycals.

The data from this project served as the basis for and justification of a human clinical trial that is now in its planning stages. In addition, this study was also the basis for the receipt of a “Bench to Bedside Award” from the National Institutes of Health. The NIH grant of \$150,000 will help defray costs of the human clinical trial. Finally, based in part on this research, Rycals received “Orphan Drug Designation” by the FDA. This official status is granted by the FDA only to drugs that show promise in the treatment of rare or “orphan” diseases.

3D Schematic of the Ryanodine Receptor Developed by Dr. Andrew Marks.

“I am proud that the RYR-1 Foundation has played such a critical role in advancing Rycals to a human clinical trial. Without the funding from our organization, this research could not have occurred,” said Dr. Michael F. Goldberg, President of the RYR-1 Foundation. “Ultimately, our hope is that this research will lead to an effective treatment for RYR-1 muscle disease and an improvement in the lives of our patients.”

SCIENTIFIC ADVISORY BOARD

The Scientific Advisory Board (SAB) of the RYR-1 Foundation is a group of the world's leading authorities in RYR-1-related diseases. The SAB determines the research priorities of the RYR-1 Foundation. It meets on a regular basis to evaluate prospective research proposals and to track the progress of funded research.

Attendees of an RYR-1 Scientific meeting in July 2016. Participants included representatives from academia, the pharmaceutical industry, NIH, and patient advocacy organizations.

ANDREW R. MARKS, MD (CHAIR)

Dr. Marks is Chairman of the Department of Physiology and Cellular Biophysics and The Clyde and Helen Wu Professor of Medicine and Pharmacology at Columbia University in New York City. He is the former Editor-in-Chief of the Journal of Clinical Investigation. He

Dr. Andrew Marks giving a lecture at the 2018 RYR-1 International Family Conference.

is also a member of the National Academy of Medicine. Additional honors include the Established Investigatorship Award and the Basic Research Prize from the American Heart Association, the Distinguished Clinical Scientist Award of the Doris Duke Charitable Foundation, and memberships in the American Society of Clinical Investigation, the American Association of Physicians, the American Academy of Arts and Sciences, and the National Academy of Sciences.

Dr. Marks discovered that “leaky” intracellular calcium release channels (ryanodine receptors) contribute to heart failure and impaired exercise capacity, particularly in muscular dystrophy. His

research has provided groundbreaking insight into RYR-1-related diseases for over 25 years, including the cloning of RYR-1 DNA in 1989 and the discovery in 2014 of the high-resolution structure of the RYR-1 receptor.

Based on fixing the “leak” in the ryanodine receptor/calcium release channels, Dr. Marks’s research is in clinical trials for the treatment of heart failure, cardiac arrhythmias, and muscular dystrophy. He is the chair of the SAB for Armgo Pharma, Inc., a company he founded in 2006 to develop novel therapeutics for diseases related to the ryanodine receptor, and he is the inventor on six U.S. patents for these new treatments.

CARSTEN G. BÖNNEMANN, MD

Dr. Bönnemann is a pediatric neurologist specializing in neuromuscular disorders and neurogenetics. He is a Senior Investigator in the Neurogenetics Branch and Chief of the Neuromuscular and Neurogenetic Disorders of the Childhood Section of the National Institute of Neurological Disorders and Stroke at the National Institutes of Health in Bethesda.

Dr. Bönnemann is also Adjunct Professor of Neurology at the University of Pennsylvania and the Children’s Hospital of Philadelphia (CHOP). He is a member of the Executive Board of the World Muscle Society as well as Co-Editor-in-Chief of the Journal of Neuromuscular Disease. Dr. Bönnemann is an internationally recognized expert in the diagnosis of neuromuscular diseases. His research is dedicated towards understanding the molecular genetics and cell biology of muscular dystrophies and early onset myopathies in order to develop molecular-based treatments. Dr. Bönnemann was a Pew Scholar in the Biomedical Sciences, and received the Derek Denny-Brown Neurological Scholar Award of the American Neurological Association.

ROBERT T. DIRKSEN, PhD

Robert T. Dirksen, PhD is the Lewis Pratt Ross Professor and Chair of Pharmacology and Physiology at the University of Rochester Medical Center. Dr. Dirksen obtained his BS in Biology and Chemistry from the University of Notre Dame, and MS and PhD in Pharmacology

Dr. Robert Dirksen giving a lecture at the 2018 RYR-1 International Family Conference.

from the University of Rochester. Dr. Dirksen has focused much of his scientific efforts on understanding the underlying defects of skeletal muscle in patients with Myotonic Dystrophy, Malignant Hyperthermia, Central Core Disease, and other RYR-1-related muscle diseases. His particular focus has been on understanding the control of calcium movements in muscle and the complex relationship between altered calcium movements and abnormal muscle function. His work has shown that dysfunction in calcium flow through RYR-1 calcium channels is the underlying cause of muscle weakness in patients with RYR-1 muscle disease.

His work has been funded by the National Institutes of Health and the Muscular Dystrophy Association, among others. He has published over 80 original research articles in leading scientific journals. Dr. Dirksen is currently the Past-President of the Society of General Physiologists and serves on the editorial boards of several journals, including the Journal of General Physiology, Skeletal Muscle, and Frontiers in Skeletal Muscle Physiology. He was Chair of the 2015 Gordon Research Conference on Muscle: Excitation-Contraction Coupling, and has served on several NIH Study Sections related to muscle biology and disease.

“Dr. Dirksen is so important to the RYR-1 Foundation—his discoveries on how muscle cells with RYR-1 mutations function have helped many other scientists around the world!”

ATTENDEE, 2018 RYR-1 FAMILY CONFERENCE

JAMES DOWLING, MD, PhD

Dr. Dowling is a clinician-scientist who is focused on gene discovery and therapy for childhood muscle diseases. He is an Assistant Professor of Neurology at the University of Toronto and a neurologist at the Hospital for Sick Children in Toronto. He is also the inaugural Mogford Campbell Chair in Pediatric Clinical Neuroscience at Toronto’s Hospital for Sick Children.

Dr. Dowling is considered one of the world’s leading experts in RYR-1 muscle disease. His research spans the continuum from new gene discovery to disease pathogenesis in genetically modified organisms. He is also engaged in targeted drug discovery for RYR-1-related myopathies. His laboratory employs both the zebrafish and mouse model systems, along with complementary in vitro analyses. Dr. Dowling is the recipient of numerous NIH and private foundation research grants. Recently, in conjunction with the Toronto Centre for Phenogenomics, he has developed a transgenic mouse line carrying an RYR-1 mutation.

SUSAN HAMILTON, PhD

Dr. Hamilton is the Chair of the Department of Molecular Physiology and Biophysics at the Baylor College of Medicine, and also serves as Professor in that department. For over 30 years, she has studied excitation-contraction coupling in skeletal muscle and the molecular mechanisms of human diseases related to E-C coupling. In doing so, she has become one of the world’s leading experts in the mechanisms underlying the disease processes of malignant hyperthermia (MH) and central core disease (CCD), both of which are related to mutations in the RYR-1 gene. This has led to research for possible therapeutic interventions. Her lab created the first mouse model (a knock-in mutation into RyR-1) of malignant hyperthermia and has also created a mouse model of CCD.

Dr. Hamilton has been the senior author on numerous peer-reviewed publications, and her research has been funded continuously by NIH grants. She is the former Senior Vice President and Dean of Research at the Baylor College of Medicine. She is also the recipient of numerous

honors, including membership on the Board of Trustees of the Gordon Research Conference. She was also the recipient of the 2010 Mayerson-DiLuzio Award from Tulane University.

Dr. Hamilton is the senior author of a groundbreaking article titled “A chemical chaperone improves muscle function in mice with a RyR1 mutation”. The article discusses the potential role of 4-phenylbutyrate (4PBA) as a treatment in improving muscle function in mice carrying the I4895T mutation in RyR1. To read this article, please visit: <http://www.ryr1.org/medical-literature>.

LIVIJA MEDNE, MS, CGC

Ms. Medne is a senior genetic counselor in the Divisions of Human Genetics and Neurology and a co-director of the Roberts Individualized Medical Genetics Center (RIMGC) at The Children’s Hospital of Philadelphia (CHOP). For the last 15 years, she has specialized in neuromuscular and neurogenetic disorders and served as a CHOP co-investigator for several clinical research trials and patient registries. As a genetic counselor, her goal is to facilitate accurate and genetically confirmed diagnosis for all children with suspected neuromuscular disorders and other diagnoses. More recently, she has developed expertise in large-scale genomic testing and played a critical role in developing the RIMGC program at CHOP to allow for incorporation of genomic testing into clinical practice. With increasing numbers of testing options and modalities, it is critically important that each and every individual gets access to the right test at the right time. Ms. Medne has developed significant expertise in interpreting genetic testing results for neuromuscular disorders, including RYR1-related myopathies. While many genetic neuromuscular diagnoses still lack targeted therapies, they can be better managed and treated when the exact molecular diagnosis is known.

Ms. Livija Medne giving a lecture at the 2018 RYR-1 International Family Conference.

Dr. Sheila Riazhi giving a lecture at the 2018 RYR-1 International Family Conference.

SHEILA RIAZI, MSc, MD, FRCPC

Dr. Riazhi is an Associate Professor at the Department of Anesthesia, and Adjunct Professor at the Department of Kinesiology at University of Toronto, and a staff anesthesiologist at University Health Network (Toronto Western Hospital). Dr. Riazhi also directs the only Canadian diagnostic center for malignant hyperthermia (MH), where she assesses at-risk individuals and provides genetic testing and the caffeine-halothane contracture test (CHCT). Her

research interests include pathophysiology of MH, links with exertional heat illnesses, and phenotypic variability in MH susceptible patients.

Dr. Riazi has received several teaching and research awards and had secured funding from Canadian and American grant agencies. She is also a member of the MH International Professional Advisory Council, the board of directors of MH Association of the United States (MHAUS), and a member of the editorial board of the Canadian Journal of Anesthesia.

SUSAN TREVES, PhD

The main focus of Dr. Treves's laboratory at the University of Basel in Switzerland, is to study intracellular calcium homeostasis in mammalian cells under normal and pathological conditions, with particular emphasis on skeletal muscle excitation-contraction coupling. One of the models she uses to study calcium dysregulation in skeletal muscle is unique to her laboratory, because she uses biopsy-derived human skeletal muscle cells differentiated into myotubes in vitro. As a result of her PhD work in the laboratory of Prof. Tullio Pozzan, one of the pioneers in the development of fluorescent Ca²⁺ indicators, she has a broad understanding on the use, pitfalls, and advantages of the available methods to study calcium homeostasis with fluorescent calcium indicators. This expertise coupled with access to clinical material, has allowed her laboratory to directly assess the effect of mutations in the human ryanodine receptor calcium channel in muscles obtained from patients affected by neuromuscular disorders. Her laboratory applies a broad range of techniques, including cell and tissue culture, molecular biology, cell biology, biochemistry, microscopy, imaging, and fluorescence measurements of intracellular [Ca²⁺].

NICOL C. VOERMANS, MD, PhD

Dr. Voermans's research at the Radboud University Medical Centre (The Netherlands) focuses around genotype-phenotype comparisons and trial-readiness of rare inherited myopathies. As a clinical neurologist trained in neuromyology and experienced in translational research, she is well prepared to bridge the gap between the neuromuscular bench and bedside. Her passion for supporting patients with rare genetic disorders and her enthusiasm for interdisciplinary work are what drove her to this research field.

Dr. Voermans has focused on congenital myopathies, with a special interest in the clinical presentations and pathophysiology of RYR1-related myopathies. In 2014, Dr. Voermans gained experience in functional analysis of the RYR1 channel in the lab of Dr. Susan Treves in

RYR-1 Foundation President Dr. Michael Goldberg is joined by members of the RYR-1 Foundation Scientific Advisory Board in Naarden, Netherlands at the RYR-1 Workshop of the European Neuromuscular Centre in January 2016. This workshop was co-sponsored by the RYR-1 Foundation.

From left to right: Dr. Robert Dirksen, Dr. James Dowling, Dr. Susan Hamilton, Dr. Michael Goldberg, Dr. Andrew Marks.

Switzerland. Dr. Voermans has focussed on the wide spectrum of RYR1-related myopathies throughout life, including intermittent phenotypes such as exertional rhabdomyolysis. She is a medical advisor to the congenital myopathies group of the Dutch patient organization for neuromuscular disorders.

Recently, Dr. Voermans has extended her scope to include other congenital myopathies (centronuclear myopathies, nemaline myopathies, and SEPN1-related myopathies) and facioscapulohumeral muscular dystrophy (FSHD). Her research in these myopathies has increased the knowledge of geno-and phenotypes, natural history, and outcome measures, all of which are crucial for future trials.

Dr. Sheila Riazi (center), member of the RYR-1 Foundation Scientific Advisory Board, at the 2018 RYR-1 International Family Conference.

Dr. Ronald Litman, Vice President of the Malignant Hyperthermia Association of the United States, speaking at a patient "Q & A" session at the 2016 RYR-1 International Family Conference.

ONGOING ACTIVITIES

PATIENT REGISTRY:

Developing a list of patients with RYR-1-related diseases is critical for research, as it allows physicians to learn about the natural history of this disease. Furthermore, as any potential therapy must be tested in a clinical trial prior to FDA approval, having a patient database is essential in encouraging pharmaceutical companies to develop therapies for this “orphan” disease.

FUNDING OF RYR-1 RESEARCH MEETINGS:

International research meetings are essential for the dissemination of new scientific discoveries. They are also important for networking and the sharing of ideas among clinicians, basic science researchers, and the pharmaceutical industry. The RYR-1 Foundation has sponsored various meetings, including: Gordon Research Conference, World Muscle Society, International Congress on Neuromuscular Diseases, and European Muscle Conference. The Foundation has also co-hosted and sponsored a meeting at the European Neuromuscular Centre specifically on RYR-1-related diseases.

All meetings of the RYR-1 Foundation Scientific Advisory Board are funded solely by the Foundation.

FUNDING BASIC AND CLINICAL RESEARCH:

Acquiring funding for clinical research for a rare disease can be challenging for clinicians and scientists. As a relatively small organization focusing on a single condition, the RYR-1 Foundation has worked successfully with researchers to obtain funding for the translation of basic research to future clinical trials.

FAMILY CONFERENCES

The RYR-1 Foundation held the first ever RYR-1 International Family Conference in July 2016 in Baltimore and the second RYR-1 International Family Conference in July 2018 in Pittsburgh. Combined, these events have hosted 388 attendees, representing 75 RYR-1-affected families from 31 states and eight countries. These conferences are unique opportunities for affected individuals and families to meet, form friendships, gain knowledge, and develop a true RYR-1 community.

For a rare condition like RYR-1-related diseases, providing a forum for affected individuals and families to meet others like them has significant psychological value. When an affected individual or their family members seek to find someone else who understands what they have experienced, a family conference becomes an invaluable and necessary resource. It is a goal of the Foundation to enhance and enrich these relationships within the RYR-1 community by hosting International Family Conferences every other year.

To view a documentary about the RYR-1 International Family Conferences, please go to: WWW.RYR1.ORG/CONFERENCES

Below: Photos from the 2018 RYR-1 International Family Conference. The next Family Conference is scheduled for July 2020.

Group photograph of attendees of the 2018 RYR-1 International Family Conference, July 13–15, 2018 in Pittsburgh, PA.

“To meet a whole staff of doctoral level scientists spending their lives researching the disease that impacts our families’ lives so drastically was so powerful!

ATTENDEE, 2018 RYR-1 INTERNATIONAL FAMILY CONFERENCE

If not for attending the conference, there is no telling how long these concerns would have went unchecked. I can't thank y'all enough for all that we have learned from the conference!

ATTENDEE, 2018 RYR-1 INTERNATIONAL FAMILY CONFERENCE

SUPPORT AND ADVOCACY FOR AFFECTED INDIVIDUALS AND FAMILIES

Due to the rarity of RYR-1-related diseases, this diagnosis can be anxiety-provoking and isolating for individuals and their families. The Foundation serves as a resource, primarily through our website (www.ryr1.org) and Facebook page (www.facebook.com/ryr1foundation), in which individuals can access a wealth of information.

Educational videos about RYR-1-related diseases can be viewed directly on the RYR-1 Foundation's website:

NOLAN'S STORY

Nolan's doctors noticed there was something wrong the moment he was born. His weakness at birth was so profound that it took Nolan several weeks to even open his eyes or move a finger. Nolan spent the first two months of his life in the hospital. Mandy, Nolan's mother, recalled grieving for the loss of the typical mother-newborn bonding experience, as she was unable to take Nolan home to simply "cuddle on the couch."

Nolan is a young boy who is affected with RYR-1 muscle disease. Although Nolan's strength has improved somewhat since birth, he currently cannot sit independently, lift his head, eat, or clear his oral secretions. This puts him at risk for numerous medical complications, including life-threatening infections.

When Nolan's parents learned of the RYR-1 Foundation, they were shocked that an organization existed specifically to help individuals with Nolan's rare disease. When asked about the RYR-1 Foundation's mission to support research for RYR-1-related diseases, Mandy said, "It is everything--the most important thing. If we only get one thing in life, it would be to have a treatment or a cure for Nolan."

Eager to accelerate the pace of research, Lindsey, Nolan's Aunt, recently organized a fundraiser, "Hike for Team Nolan," which raised over \$11,000 for the RYR-1 Foundation. In reference to the RYR-1 Foundation and the "Hike for Team Nolan," Mandy says, "When we got Nolan's diagnosis, we never dreamed that a cure was even possible. Recent developments in gene therapy make us believe that it is more than possible, and **we are hopeful that through the work of the RYR-1 Foundation, Nolan will someday be able to complete this hike alongside his Aunt Lindsey.**"

To watch a video on "Nolan's Story," please go to: WWW.RYR1.ORG/NOLAN

JACKSON'S STORY

Jackson is a young boy with RYR-1 myopathy. He is currently unable to walk without assistance and is forced to alternate between a wheelchair and walker.

Jackson's mom, Marcie, noticed problems with Jackson at 3 days after birth, when he was unable to breastfeed due to weakness in his facial muscles. At 6 months of age, he had hip surgery--this would be the first of many surgeries, which often required prolonged inpatient stays and intensive outpatient therapy.

Currently, he sees numerous specialists to deal with complications related to his RYR-1 myopathy, including neurologists, orthopedists, and pulmonologists. In addition, he must use a walker, orthotic braces, a gait trainer, quad canes, and a wheelchair. His family's home has had to be adapted to include a ramp and stairlift.

"The RYR-1 Foundation will change so many lives, and I am excited about its impact on ours."

MARCIE, JACKSON'S MOTHER.

In addition to the physical toll this disease has taken on Jackson, there is a significant psychological component as well. Marcie wrote to the Foundation: "Jackson is very aware that he is different from other children. Around age 5, he was very angry and upset about his disability....He cries easily if he thinks someone is staring at or making fun of him."

Despite all of this, Jackson is outgoing, friendly, and intelligent. He plays sled hockey and challenger baseball.

To watch a video on "Jackson's Story," please go to: WWW.RYR1.ORG/JACKSON

BRENTNEY'S STORY

When Brentney was born in 1993, her parents noticed something was wrong right from birth. Doctors told her family that they did not think she would ever be able to walk or talk. Nevertheless, each and every day, Brentney has continued to exceed everyone's expectations.

Like many other individuals with RYR-1 myopathy, Brentney was initially misdiagnosed. Due to her rapid health decline in 2015, she and her family became skeptical about her initial diagnosis, which led to genetic testing. It was not until January 2016, at the age of 22, that Brentney received her true diagnosis - RYR-1 myopathy.

Despite unanswered questions and countless doctor appointments, Brentney and her family continue to remain optimistic, hopeful, and inspirational. On May 6, 2016, Brentney graduated with her associate's degree from Trident Technical College. Although there were some serious health roadblocks along the way, Brentney never felt defeated. She accomplished a milestone in her life that no one can ever take away from her.

"Up until meeting other individuals of the RYR-1 community, no one else could fully understand what I have been going through...for that, I am forever grateful."

BRENTNEY, AFFECTED WITH RYR-1 MYOPATHY

As an attendee of the first RYR-1 International Family Conference in 2016, Brentney personally experienced the value of the RYR-1 Foundation. "After discovering the RYR-1 Foundation, I was finally able to interact with and meet people who could identify with the same things I was going through," Brentney explains.

To watch a video on "Brentney's Story," please go to: WWW.RYR1.ORG/BRENTNEY

CODY'S STORY

As the 10th overall pick in the 2008 NHL Draft, Cody Hodgson had a bright career ahead of him in the NHL. Cody played for the Vancouver Canucks, Buffalo Sabres, and Nashville Predators over the course of a six-year career. Although Cody had experienced muscle cramps his entire life, he dismissed them as a regular part of being a competitive athlete. As his symptoms become more severe during his professional playing days, he recalled, "I knew I had to get medical help." He experienced many distressing signs and symptoms, including: trouble breathing, heart arrhythmias, severely low blood pressure resulting in "blacking out," and tea-colored urine. The severity of these symptoms culminated in a hospitalization in 2015, when doctors diagnosed him with rhabdomyolysis, a severe and potentially fatal condition related to abnormal muscle breakdown.

Cody (right) at the 2018 RYR-1 International Family Conference with Lindsay Goldberg (left) and Cody's brother, Clayton (middle).

During the 2015-2016 season with the Predators, Cody was referred to Dr. Sheila Riazi, an anesthesiologist and one of the world's leading experts on malignant hyperthermia, a muscle condition most commonly due to a mutation in the RYR-1 gene. Dr. Riazi, a member of the RYR-1 Foundation's Scientific Advisory Board, quickly realized that Cody's numerous injuries, severe symptoms, and episode of rhabdomyolysis were all likely due to RYR-1-related malignant hyperthermia. She ordered genetic testing and a muscle biopsy, which confirmed the diagnosis.

Receiving this diagnosis from Dr. Riazi was a source of tremendous relief for Cody. "You put up with a lot of injuries and it takes a physical toll when you play hockey," Cody said "but it really scares you when you are not sure what is going on with you."

Dr. Riazi informed Cody of the RYR-1 Foundation and put him in touch with its President, Dr. Michael Goldberg. After meeting with Dr. Goldberg in early 2018 and learning more about the work of the RYR-1 Foundation, Cody said,

"Hopefully, the RYR-1 Foundation and I can help to not only push for a cure, but also help the parents, patients, and families affected by it now so that they can better understand their condition, take the appropriate precautions, and have a treatment available to them."

HOW A GIFT TO THE RYR-1 FOUNDATION CAN HELP

Costs of Research:

\$500:

Supports the purchase of lab supplies.

\$2,000:

Partial salary support for lab technicians.

\$60,000:

The cost of developing each mouse model with a mutation in the RYR-1 gene.

\$120,000-\$150,000:

The annual cost of a basic science research project (lab equipment, staff salaries, supplies, etc).

\$750,000-\$1,000,000:

Cost of a Phase I clinical trial to assess safety of a drug.

\$2,000,000-\$3,000,000:

Cost of a Phase II clinical trial to assess effectiveness of a drug.

To make a donation to the RYR-1 Foundation, please go to:

The official registration and financial information of The RYR-1 Foundation may be obtained from the Pennsylvania Department of State by calling toll free, within Pennsylvania, 1 (800) 732-0999. Registration does not imply endorsement.

WHO WE ARE

RYR-1 Foundation President, Dr. Michael Goldberg (right) and Vice President, Dr. Morton Goldberg (left).

MICHAEL F. GOLDBERG, MD, MPH, PRESIDENT, TRUSTEE

Mike is President and Co-Chair of Research of the RYR-1 Foundation. He is a neuroradiologist and is the Director of Neuroradiology at the Allegheny Health Network in Pittsburgh. He is an Associate Professor at Drexel University College of Medicine. He can be reached at mike@ryr1.org.

MORTON F. GOLDBERG, MD, FACS, VICE PRESIDENT, TRUSTEE

Along with Mike, Mort is the Co-Chair of Research. He is also an ophthalmologist specializing in inherited retinal diseases. He is the Joseph Green Professor of Ophthalmology at the Johns Hopkins School of Medicine and the Director Emeritus of the Wilmer Eye Institute in Baltimore. He is a member of the National Academy of Medicine of the National Academies of Science of the United States.

LINDSAY GOLDBERG, RN, SECRETARY, TREASURER, TRUSTEE

Lindsay acts as a liaison between affected individuals and their families along with physicians, genetic testing companies, and scientists. She has a BSN from the University of Michigan and is a registered nurse who worked for 10 years specializing in pediatric cardiac intensive care. She can be reached at lindsay@ryr1.org.

RYR-1 Foundation Secretary and Treasurer Lindsay Goldberg (left) with a conference volunteer.

MICHAEL LEGUM, ASSISTANT TREASURER, TRUSTEE

Mike is a senior portfolio manager for Park Circle Investments, a Baltimore-based private investment company. Prior to Park Circle, he worked in the film business, spending five years at New Line Cinema. He is a graduate of the University of Pennsylvania with a B.A. in English.

RYR-1 Foundation Trustees and Program Director at the 2018 RYR-1 International Family Conference.
